Reverse engineering compressed zip files This is the process of finding the original files of a zip archive using a decompression program such as 7-Zip, WinZip, or WinRAR. It involves analyzing the structure of a zip file and extracting the data in the zip file so that it can be opened with a decompression program. Folders and files in a zip archive Zip archives store data as a series of files, usually organized in directories that resemble the folders in a file system. The zip file is divided into chunks called sectors or sectors. A sector usually contains information about one of the files in the archive. The archive file format specification specifies that, when a file in a zip archive is about to be written, the last sector of that file should be saved first. This is followed by the central directory, which specifies the beginning and the end of each of the individual directories in the zip archive. The central directory contains the name of the zip archive, the version number, the time of the archive creation, and the size of the zip archive. The files in a zip archive are also referred to as "entry" files or just "entry", 2d92cc491b
