The developer of your software is very kind to us. Just a little reminder. :) This invention relates to a device for folding sheet material, in particular paper and the like, which has a pair of folding rollers, a pressure roller, a folding box in which the paper is engaged by the folding rollers in order to fold the paper. Heretofore, it has been known to fold a sheet of paper, for example, when it has been taken out of a copier or the like, by providing a pair of folding rollers, a pressure roller, a folding box in which the paper is engaged by the folding rollers, and bringing the folding rollers into pressure contact with the pressure roller.

According to this construction, the folded paper is held between the pressure roller and the folding rollers. In such a prior art device, the paper is folded at its folding edge portions by a pair of folding rollers, and is folded at a prescribed fold line by the pressure roller which is pressed against the folding rollers. The folded paper is moved in a folding box into which it is brought by the pressure roller and the folding rollers. In this device, however, the pressure roller, the folding rollers and the folding box are arranged in a line, and hence, the paper is inevitably subjected to friction in its passage through the device. Moreover, in the device, the pressure roller is pressed against the folding rollers. Thus, the pressure roller is liable to slip in its rotation by the force caused by the friction. The folding rollers and the pressure roller do not positively rotate at all times, and hence, the pressure roller
